GTM Operating Review & Revenue Analytics

OGN Security — FY2026 Go-To-Market Performance

A full-funnel analysis of a $750M ARR enterprise security-SaaS business: bookings and attainment, pipeline and forecast, territory and capacity, and the drivers of rep performance — built end-to-end in Python from a relational Salesforce-style data model.

Prepared by **Idris E** · October 2026 · Synthetic data for demonstration

Executive Summary

The business closed FY2026 at **$200M of New Business against a $200M target (100% attainment)**, on a 170-seller global organization, with $600M in renewals and $60M in expansion on top. Underneath that hit plan the **average rep attained 75% of quota** — the book is over-assigned at 1.24x target — and attainment varied sharply by geography, with the **MEA territory the top performer at ~103%** on war-driven demand even as Public Sector trailed near ~65%.

$200M New Business	**100%** Attainment to target	**28%** New-Business win rate
3.5x Avg pipeline coverage	**$843M** Open pipeline	**2,307** Active customers

Three findings define the year. First, **pipeline coverage is the strongest, most actionable driver of attainment** (r = +0.37): reps with 4–6x coverage reliably beat plan, thin-coverage reps are the leading indicator of a miss. Second, **win rates diverge by segment** — Commercial 39% vs Enterprise 22% — a qualification problem at the top of the market. Third, **the book is concentrated in SaaS and the Americas**, healthy for ARR quality but leaving whitespace in EMEA/APJ and the non-SaaS lines.

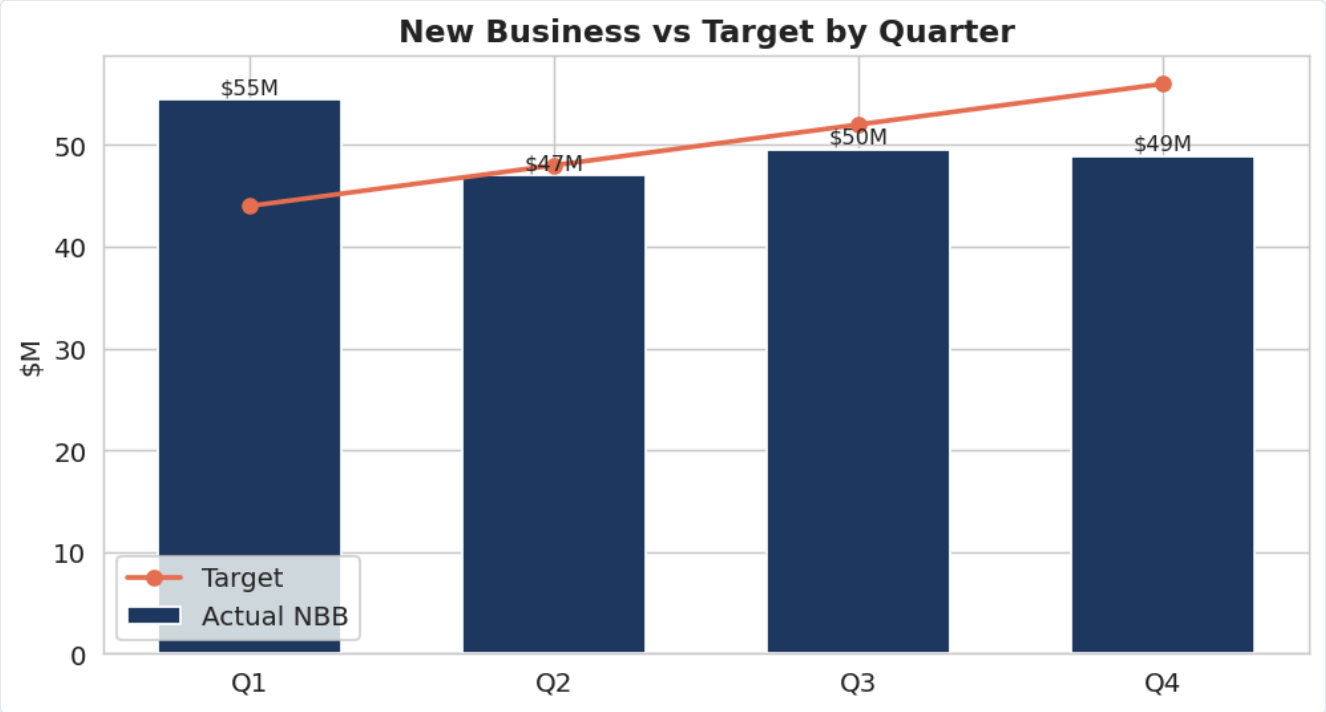

1 · Business Context & Data Model

OGN Security is a (synthetic) global enterprise security-SaaS company with ~**$750M ARR**. The analysis uses a relational model mirroring a Salesforce + planning stack: a bookings fact table joined to dimensions for accounts, product, geography, and the sales org. Four theaters (Americas, EMEA, APJ, Public Sector), a six-level hierarchy from CRO to AE, five seller titles, fifteen product families sold as SaaS / Term / Maintenance / Services / TAM, and bookings split into New / Renewal / Expansion so the New-Business engine can be measured on its own.

Table	Grain	Role
fact_bookings	one row per booked deal	New / Renewal / Expansion revenue
opportunities	one row per New-Business opp	pipeline, stage, win/loss, forecast
accounts	one row per account	segment, industry, ARR, territory owner
dim_sales_org	one row per rep	hierarchy, quota, coverage, ramp, XDR, partner
targets	theater × quarter	NBB plan

2 · GTM Operating Cadence & Attainment

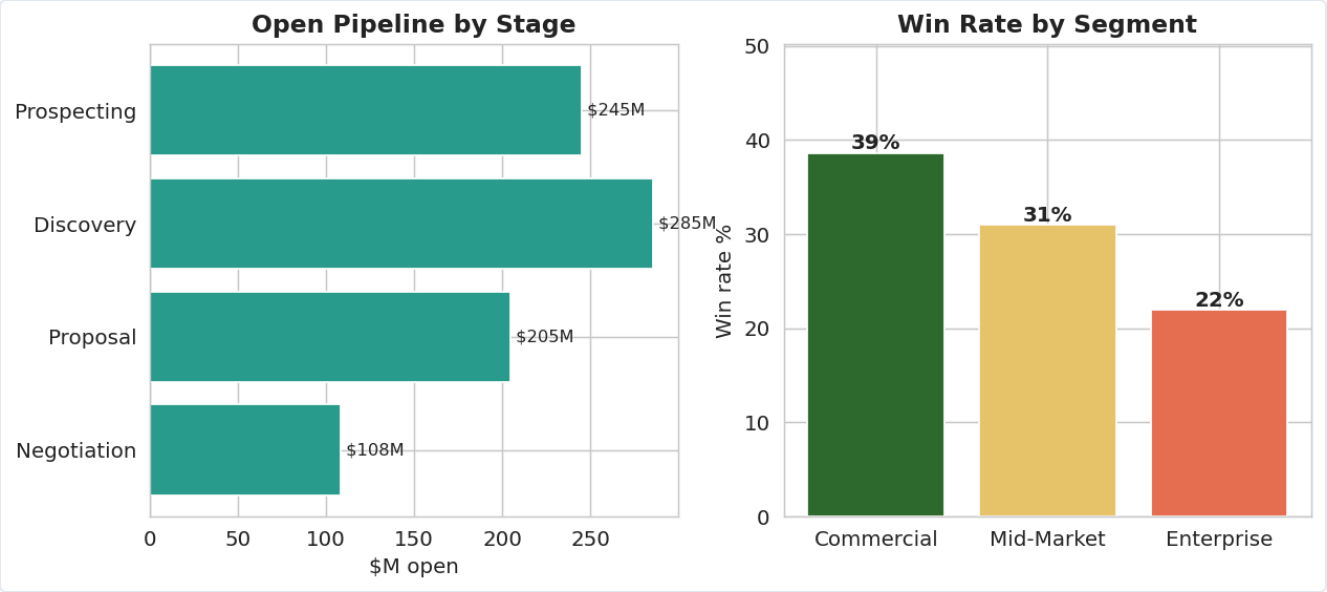

The cadence opens on New Business booked against plan: **100% of the $200M target**, building through the year as the plan back-loads to Q4. This actual-vs-target view is the backbone of the weekly pipeline review and the QBR.

Metric	Value
New Business	$200M
NBB Target	$200M
Company Attainment	100%
Renewals	$600M
Expansion	$60M
Win Rate (NB)	28%
Avg Pipeline Coverage	3.5x
Open Pipeline	$843M
Reps	170
Avg Rep Attainment	75%

3 · Funnel Performance & Win/Loss

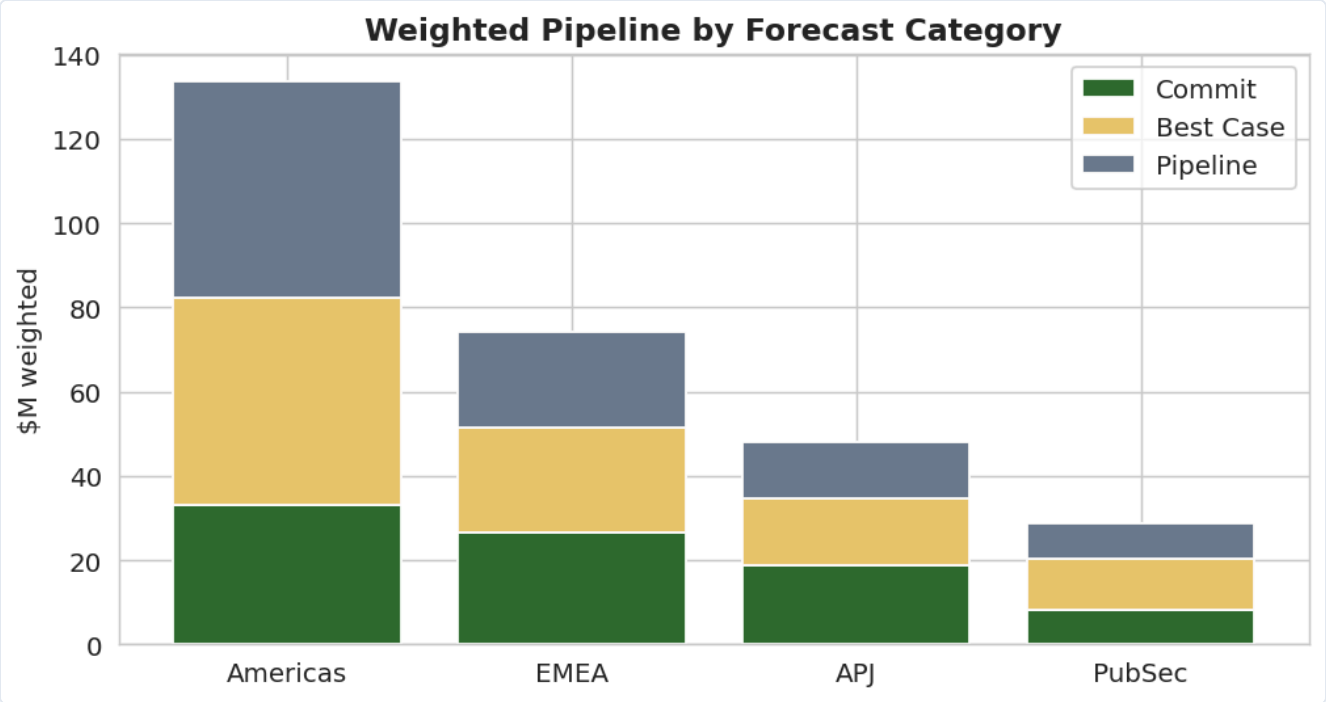

Open New-Business pipeline totals **$843M**, weighted to the early stages — healthy for future quarters but to be discounted heavily in any forecast. The revealing cut is win rate by segment: Commercial 39%, Mid-Market 31%, Enterprise 22%. A declining win rate as deals grow is expected, but a gap this wide warrants a structured win/loss program.

Segment	Closed opps	Won	Win rate
Commercial	492	190	39%
Enterprise	1253	275	22%
Mid-Market	785	243	31%

4 · Sales Forecasting

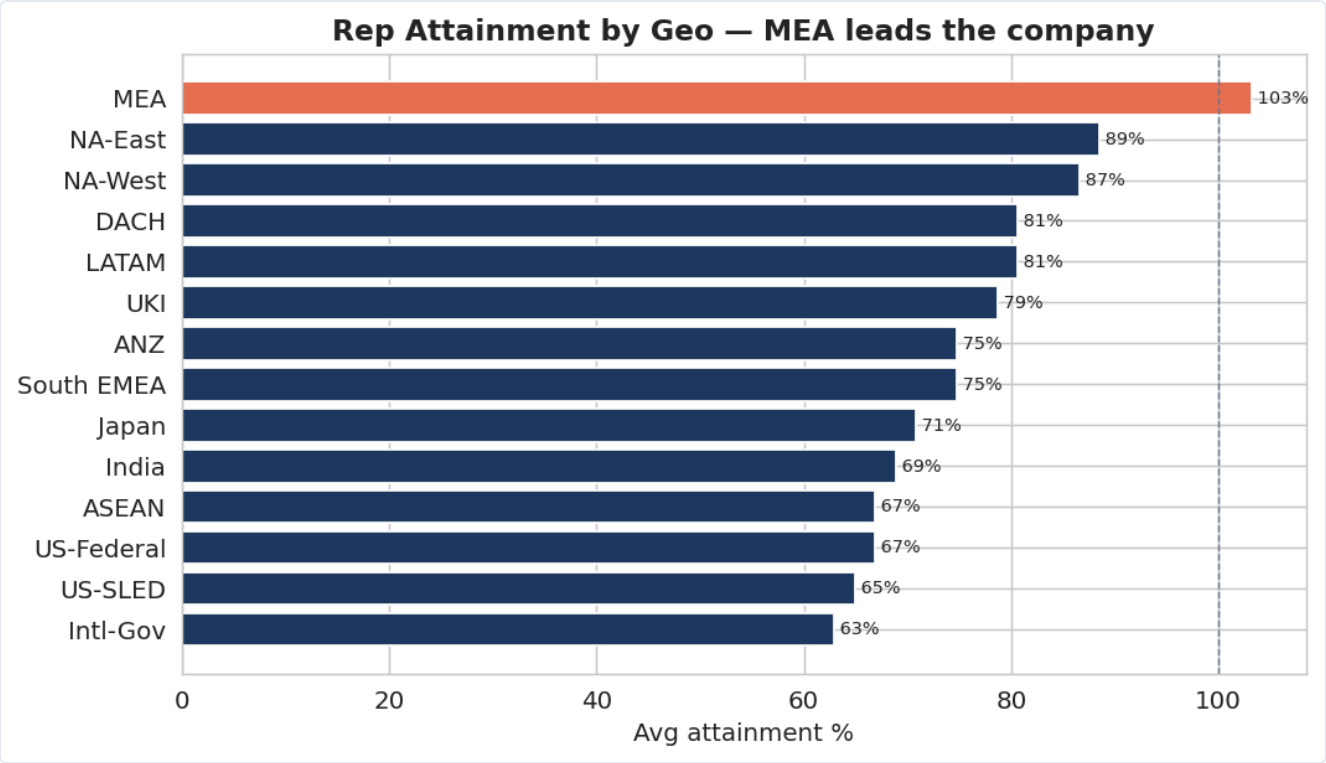

Bottoms-up: each open opportunity is weighted by its stage probability and rolled up by forecast category (Commit / Best Case / Pipeline) per theater, separating the high-confidence call from the upside. The discipline this enforces is coverage-to-target, and the weekly review tracks category movement — deals sliding from Commit to Best Case are the earliest warning of a miss.

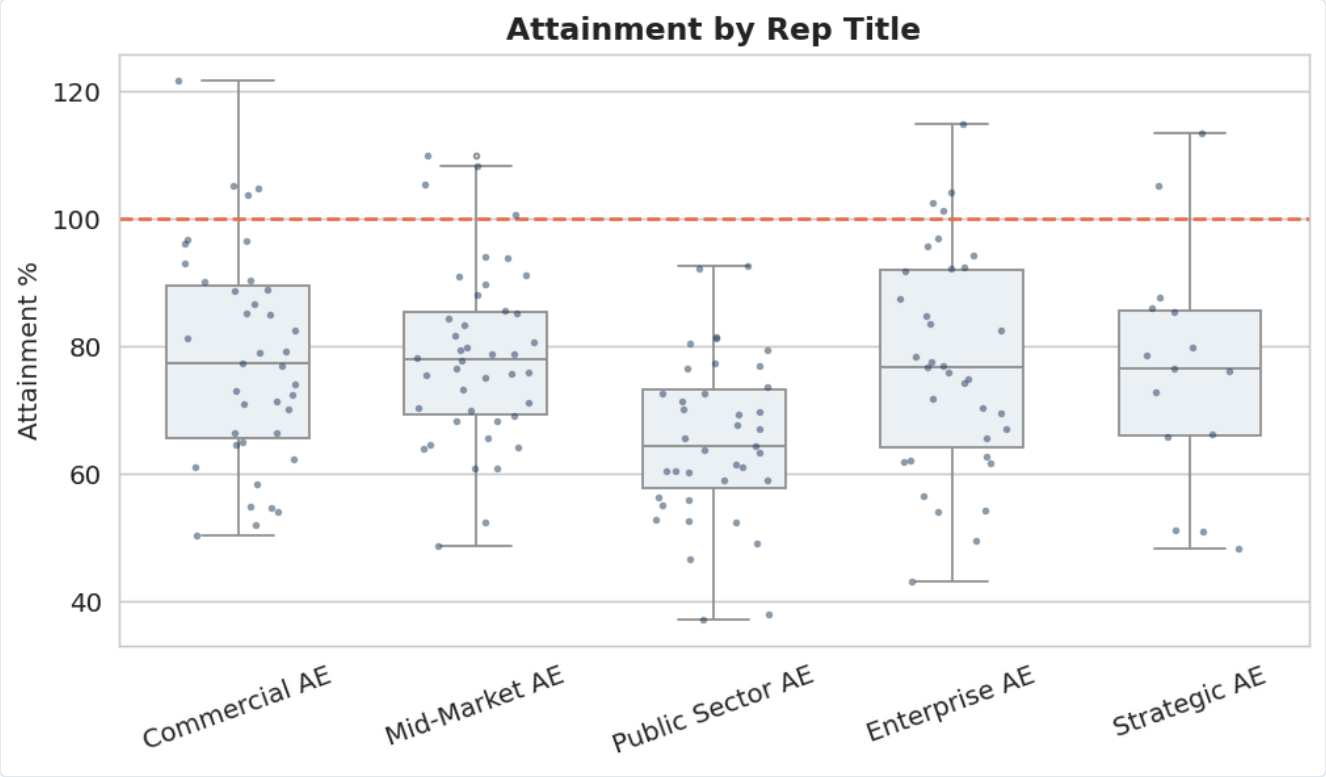

5 · Rep Performance & Attainment Drivers

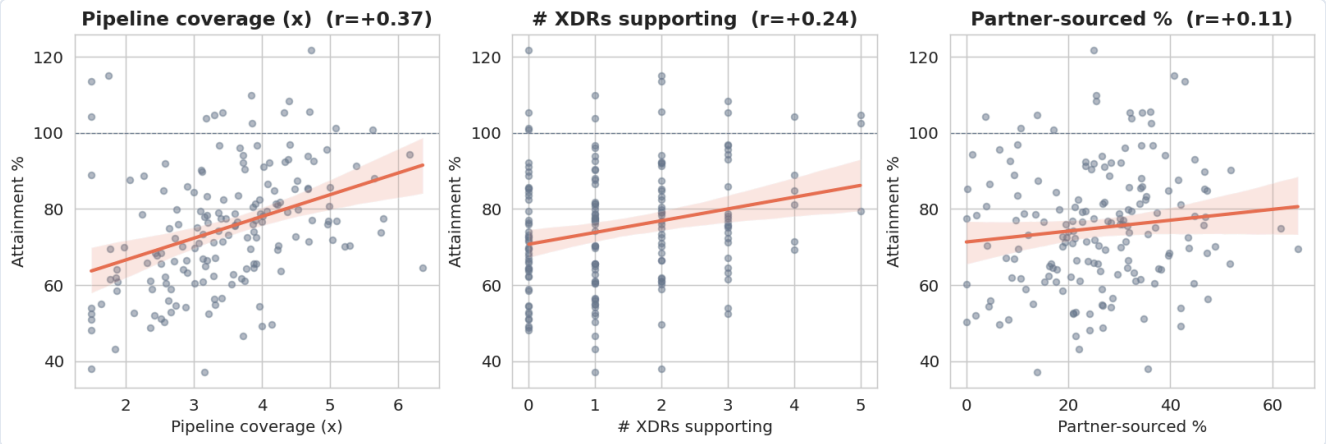

The year's key nuance: the company hit **100% of target**, yet the **average seller attained 75% of quota** — the signature of an over-assigned plan (1.24x target). A healthy business hits its number while most reps sit below 100%, which is why company attainment is never reported without the rep-level distribution.

That distribution follows a **geographic curve, and the standout runs against intuition**: the single highest-attaining geo is **MEA at ~103%** — above every Americas territory — on war-driven urgency that lands marketing with less friction and lifts the **MEA win rate to ~52% vs ~28% company-wide**. Macro conditions, not just rep skill, move a territory's number — and a geo running hot for exogenous reasons should not have its quotas permanently reset off a spike that may reverse.

Regressing attainment against candidate drivers produces a clear hierarchy.

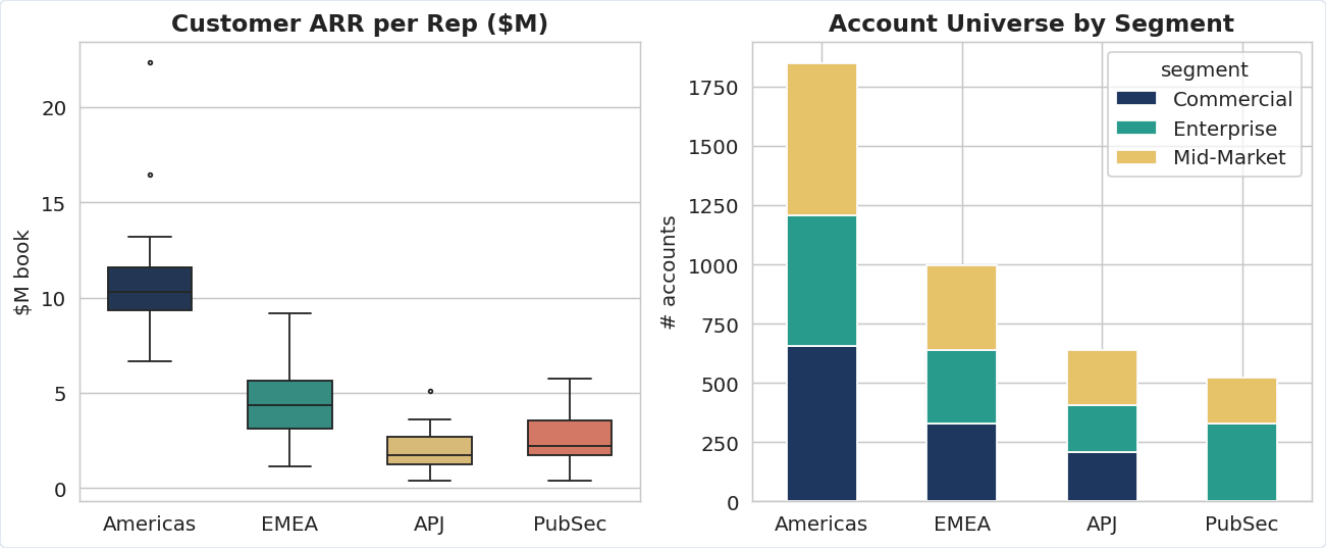

Driver	Correlation with attainment (r)
Pipeline coverage	+0.37
XDR support	+0.24
Partner-sourced %	+0.11
Rep tenure (months)	+0.09
# Deals closed	+0.30

Pipeline coverage is the dominant lever (r = +0.37). XDR support is second, partner-sourcing third; raw deal count shows no relationship. The null results make the finding credible

> — signal, not artifact.

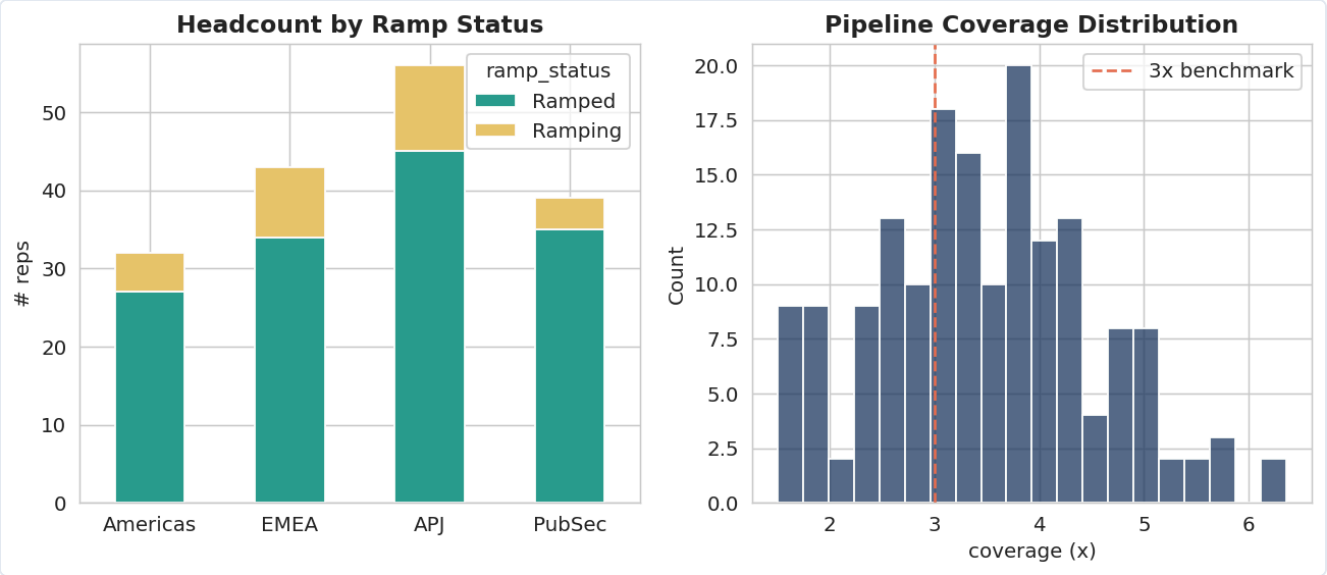

6 · Territory & Segment Model

Territory design is where coverage is won or lost before the quarter starts. Americas reps carry the largest and most variable books; uneven load is a quiet tax on attainment. A disciplined carve balances account potential, not just count.

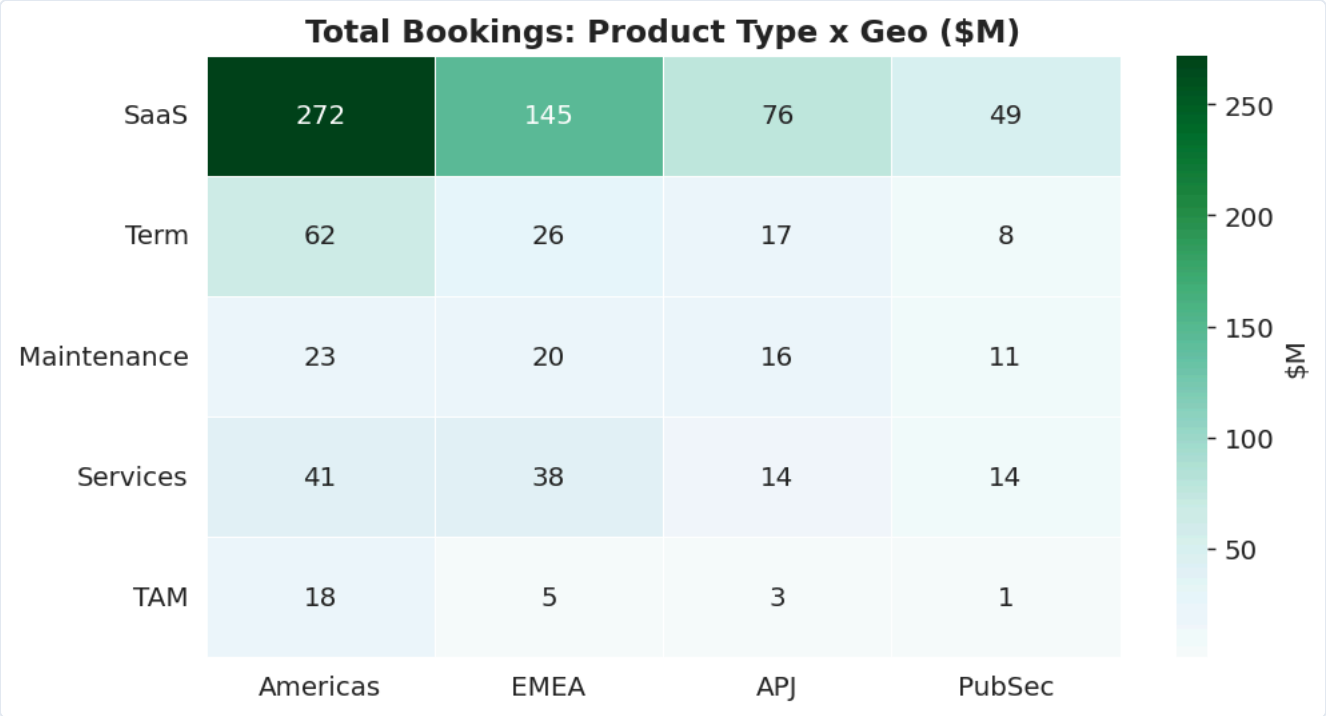

7 · Capacity, Coverage & Quota

Of 170 sellers, 29 are ramping and 141 fully productive. Total carried quota of $248M on a $200M target is ~1.24x over-assignment — the buffer that absorbs ramp and attrition. The capacity model answers: how many productive heads are needed, and when must they be hired to ramp in time?

8 · Strategic Analysis: Product × Geo

What sells where: the book is dominated by SaaS and the Americas. EMEA and APJ run below the Americas across every product type, and the non-SaaS lines are thin — each a plannable coverage or packaging decision rather than a default.

9 · Findings & Recommendations

What's working

- Company hit **100% of target**; the Americas carries the org at ~85% attainment.
- **Pipeline coverage predicts attainment** — the most coachable lever.
- ARR quality is high: **SaaS-led**, with $600M of renewals as a durable base.

Where to focus

1 · Fix Enterprise win rate (~22% vs ~39% Commercial): structured win/loss + tighter qualification.

2 · Enforce a 3x coverage floor in the weekly cadence; back-fill thin reps with XDR and partner sourcing.

3 · Set quotas to the geographic curve — treat MEA's surge (~103%, ~52% win) as exogenous and don't permanently re-base it; re-examine Strategic AE quotas.

4 · Rebalance the Americas carve to even load and protect coverage.

5 · Make a deliberate EMEA/APJ & non-SaaS whitespace decision in annual planning.

Next analytical step

Add **time-phased pipeline snapshots** to measure forecast accuracy and pipeline velocity across the quarter.

Appendix · Methodology

Computed in Python (pandas, seaborn, matplotlib) from the relational model in Section 1. Attainment = rep New-Business ARR ÷ annual quota; win rate = closed-won ÷ all closed New-Business opps; forecast weights each open opp by stage probability; correlations are Pearson. Data is synthetic and seeded; designed relationships (e.g. coverage→attainment, MEA uplift) demonstrate the analysis. This pipeline is fully refreshable.
